Performance...See It Happen.

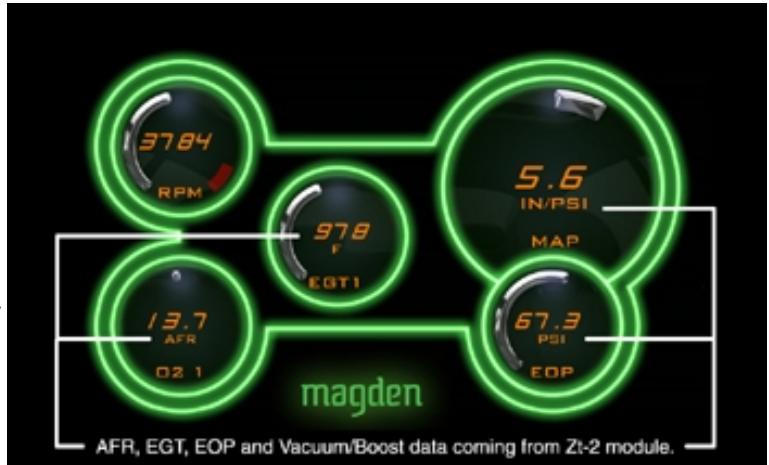

Easily Add Extra Sensors To Monitor Boost, AFR, Exhaust Temp And More

The Magden M.1b Performance Computer Integrates with Zietronix Zt-2 Modules

For Immediate Release

Lake Forest, CA - The Magden Automotive M.1b Performance Computer now has the ability to display all the information from a Zeitronix Zt-2 module. The Zt-2 module acts as a sensor hub providing an easy way to add additional sensors such as a boost gauge, exhaust gas temperature or other additional temperature sensors. The Zt-2 module also comes with a wideband lambda, delivering accurate air/fuel ratio numbers. Use of the two products allow you to see, datalog and customize just about any engine functions.

The connections are simple. Magden supplies the USB dongle that connects the Zt-2 to the Magden M.1b Performance Computer. The quick setup steps, in the M.1b Performance Computer menu system, allow the user to label each additional sensor. After that, they can select to see their newly added gauges on the screen. The M.1b will then monitor these additional functions as well as the all of the functions visible through the vehicle's Electronic Control Unit.

Data Logging is easy and all of the information can be recored onto a USB stick without worrying about data logging capacity. Magden Automotive says this is the first of many integrations scheduled for release. Some companies have already delivered their protocol specification. This enables Magden to do the integration for their customers and those looking for a better way to see the data.

You can see the integration at work, live at the Zeitronix Booth # 20433, and on the APR Performance Wide-Body, turbocharged Mustang in Booth# 24517, during the SEMA Show in Las Vegas, Nevada November 4-7th. For more information on the M.1b, available gauge skins and optional external sensors, log onto www.magden-auto.com or contact them at Magden Automotive, 25 Spectrum Point Dr., Suite 401, Lake Forest, CA 92630. (949) 599-0301.
